Forward

Field "Contact" can now be trained

The "Contact" field for the "Invoice (sent)" document type can be trained with keywords (train DeepO).

The screenshot displays the DeepO interface for processing an invoice document. On the left, a sidebar contains metadata fields for the document type "Invoice (Sent)". A yellow banner at the top of the sidebar indicates "Address not found in Abacus". The "Customer" section is populated with details for "Abacus Research AG", including the address "Abacusplatz 1, 9303 Wittenbach, CH". The "Contact" field is highlighted with a red box, and a small blue gear icon (training icon) is visible next to it. Below the sidebar are buttons for "Reject & Delete", "Skip & Next", and "Approve & Process".

The main area shows a blurred image of the invoice document, titled "ATT09103.pdf - 6 Pages". Below the document image, the "VAT POSITIONS" table is visible, showing a single entry with a VAT rate of 2.6% and a VAT amount of 32.78. The currency is set to CHF, with a total amount of 1'294.25.

Account	Code	VAT Date	VAT Rate	VAT Base	VAT Amount
Account	Code	VAT Date	2.6 %	1'261.47	32.78

Currency * CHF 1'294.25

Analysis extension

Suggestions & validations: Recognition characteristic is now searched for in the first 5 pages

Suggestion of the last document types used

The DeepO editor remembers the last document types used and displays them at the top of the selection.

Additional information in the editor

Additional information about the open file in the DeepO editor: Box name | File name | Number of pages. The organisation and section are also displayed on mouseover.

Mailroom settings moved

The mailroom settings can be adjusted in the DeepO settings at organisation level. In addition, the mailroom can now be activated in the same tab.

Renewed analysis after document type customisation

The document is re-analysed if the document type is changed manually. All values from suggestions, DeepFlow, etc. are reloaded.

Improved address recognition

Various improvements in the recognition of addresses.

Rounding differences

Rounding differences in the 'VAT' tab: the rounding amount is added to the largest VAT base.

Optimisation of the onboarding process

The login and registration process has been revised and optimised. In addition to the improvements, various bugs have been fixed.

Deactivation of automatic addition of the user in SSO configuration

Previously, all users that contained the domain that had been set up in the email address were automatically added to the organisation. There is now a setting in the SSO configuration in DeepAdmin that can be used to deactivate automatic addition.

DeepCloud invoice as PDF attachment & automated processing

If an email address is stored in the "Invoice information" in DeepAdmin (under "Subscription"), this email address will now receive invoices as PDF attachments. Owners will continue to receive the usual email notification without an attachment, as they can view the invoice in DeepAdmin at any time. This also applies if an email address is stored by an owner in the "Invoice information".

Tip: For automated processing of DeepCloud invoices, the email address of the desired inbox of an Advanced Box can be entered in the "Invoice information". The invoices are then automatically stored in the inbox thanks to the [address function](#) and can also be processed fully automatically using a flow.

Document link in email notification for rejected documents from DeepSign

A direct link can now also be found in the email notification of the rejected document from DeepSign.

Customised definition of the duration of the signature process

The `#deepsign-within#days#` placeholder can now be used to define the duration of the signature process itself. The default (without placeholder) sets the duration of the process to 30 days. The minimum is 1 day and the maximum is 90 days.

Examples:

`#deepsign-within#1#`

`#deepsign-within#90#`

Further information on the placeholders can be found under [DeepBox Support](#).

Optimisation of the visual signature

Various improvements have been made to the user interface for configuring the visual signature.
